# Pneumatic Film Spindles

WHEN AN UPGRADE IS THE SMARTER CHOICE

## Improved Roll Handling

Easier and more sanitary operation makes LeMatic's Pneumatic Film Spindle upgrade a must-have for your high-capacity packaging system. Using your existing air supply, pneumatic bladders inflate to hold the film rolls in place, and deflate for much easier roll replacement. The advanced, yet simple design eliminates the need for knives, so cut paper cores and cardboard dust contamination of product is greatly reduced.

### FEATURES

- Spindles are pneumatically-inflated to apply outward pressure to the inside of film core
- Much less effort is required to install or remove film rolls/ cores during production
- Potential for contamination on the line is reduced, as the spindles do not "bite" into the core like older styles
- Disc/caliper brake located outside the machine frame replaces band-style brake and is longer-lasting
- Brake location prevents contamination of product from brake wear
- On-the-fly adjustment capability provides lateral adjustment during operation with less interruption to production when centering the film
- Ruler imprint on the spindles make film alignment on top and bottom rolls easier, assuring a more uniform package

*Shopping for a resource for packaging films?  
Ask us about Citamel. This LeMatic subsidiary  
is the only full-service packaging resource  
dedicated to the baking industry.
